

Securitas Random Search Selectors

Random Search Selectors provide the maximum deterrent effect to potential thieves without the cost and inconvenience of stopping everyone.

The Random Search Selector is robust, reliable, and totally unbiased, providing the foundation to an effective search policy eliminating claims of prejudice, victimisation or discrimination.

How it works:

- The Selector is in view of the security personnel at the exit. All personnel press the push button prior to departure.
- A red light accompanied by a high tone indicates search; a green light with a low tone indicates a pass.
- Overall percentage of personnel to be selected can be adjusted from 0-100%.
- Selection is random and the odds of being selected are the same every time the button is pressed.
- Personnel pressing the button are unaware of Selector setting so even set at 0% it has a deterrent value
- Pressing the button maintains employee awareness of your search policy on a daily basis.

Prevention is better than cure, you do not have to wait until you have a real problem and large losses before introducing measures to prevent theft.

Example: 100 personnel leave in a 10 min time span. It takes approximately 1 min to do a thorough search of a cooperative person with one bag. The setting should be at 10%. Although only 10 people will be searched, all 100 have pressed the button and could have been selected. The deterrent is the same for everyone!

Features:

- Battery operation
- Clear indication of SEARCH and PASS with daylight visible lights and audible tones
- Portable or fixed installation.
- Desk mount, wall mount or hand held
- Large 2 inch pushbutton
- Search percentage ratio adjustable by internal switches from 0 to 100%.
- Random selection is guaranteed to be totally unpredictable
